

Battery terminal

FINECS'

Cold Heading of  
 thick material

# burr-less processing

The occurrence of burrs is NG.

Shaping by hitting the material multiple times between a specific number of molds.

Deburring is a difficult process and normally executed as separate step after processing

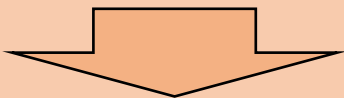

This increases the possibility of contamination.

**FINECS' original Cold Heading Technology makes burr-less processing possible → No separate deburring necessary.**

**This way we realize the optimal quality for automotive batteries.**

Burr-less, molds, process designing

burr-less Cold Heading processing

Burr-less's FINE !
